

# SOAP - Schematic

## Notes

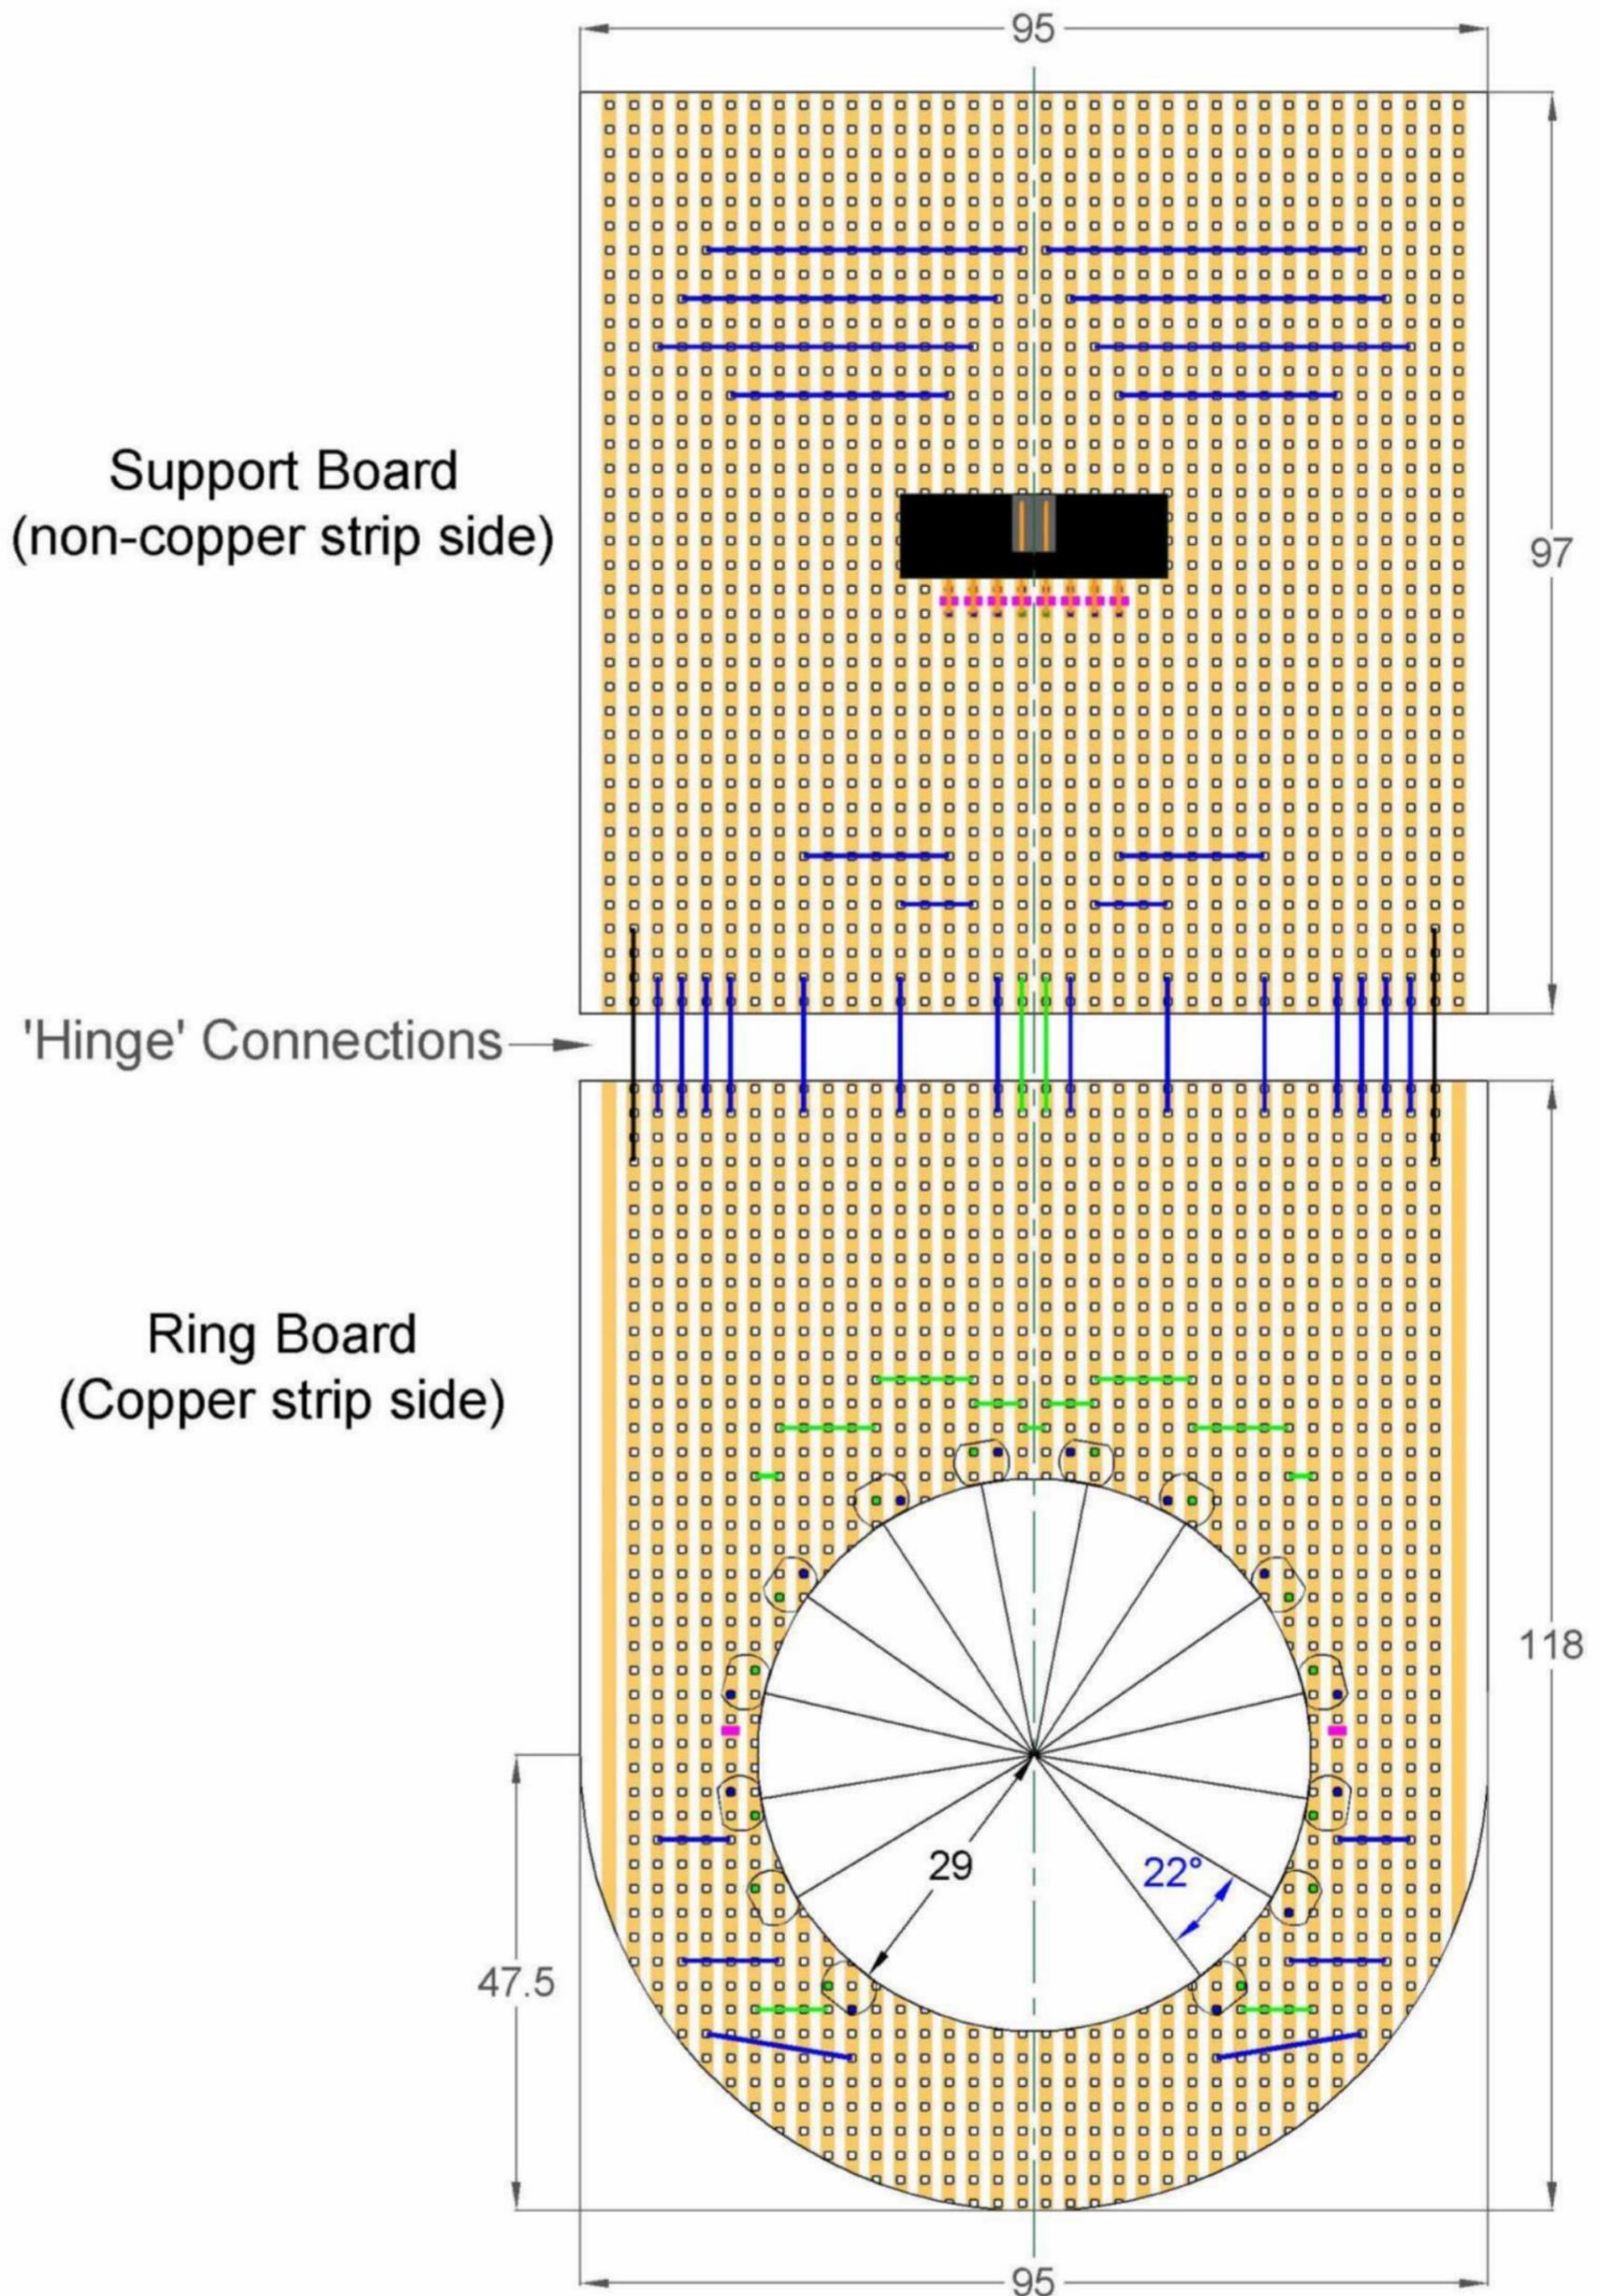

The KA02 Audio Shield is mounted on top of the UNO R3. Connections are made to the feed through sockets on the KA02.

Resistor values were determined during testing of the Ring Sensor.

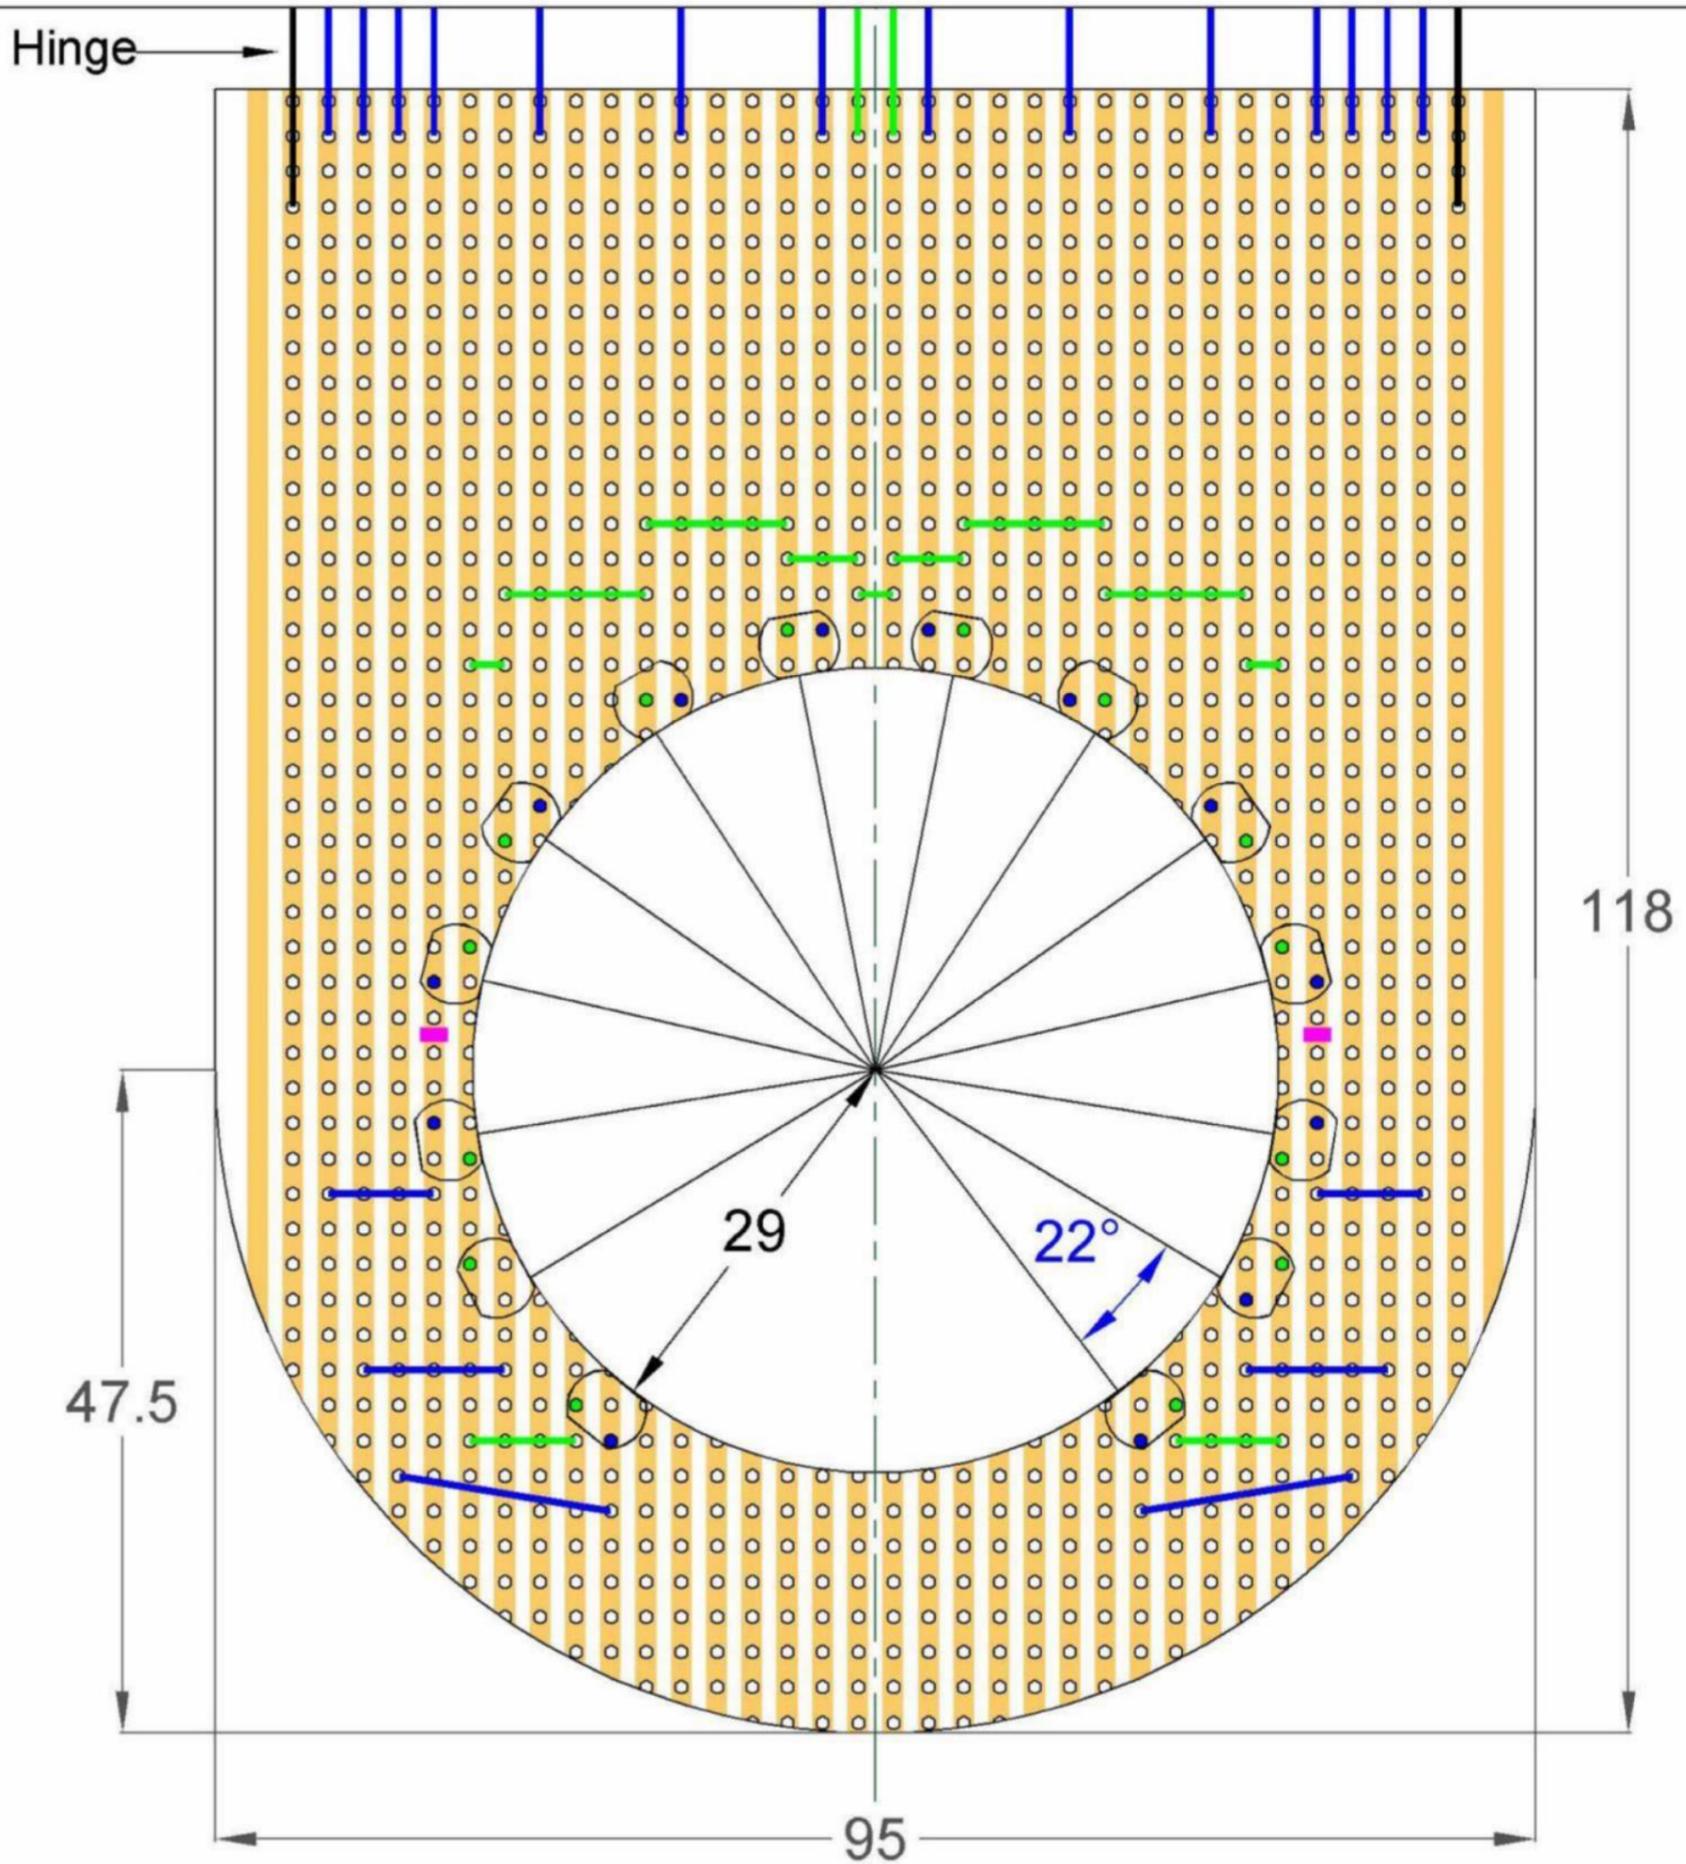

R1 and R9 differ in value from the others probably because LDR1 and LDR9 are of a different type. It was easier to adjust the resistor values than dismantle the ring sensor!

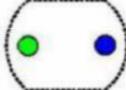

# SOAP - Sensor Overview

# SOAP - Sensor Ring Board

## LEGEND

-  Signal Wire
-  0V Wire
-  Wire for mechanical strength
-  Break in copper strip
-  Light Dependent Resistor

All components and wires installed on non-copper strip face.

# SOAP - Sensor Support Board

## LEGEND

-  Signal Wire
-  0V Wire
-  Wire for mechanical strength
-  Break in copper strip
-  16 Way Right Angle PCB Header

All components and wires installed on non-copper strip face except 'hinge' connections.

# SOAP - Testing Ring Sensor

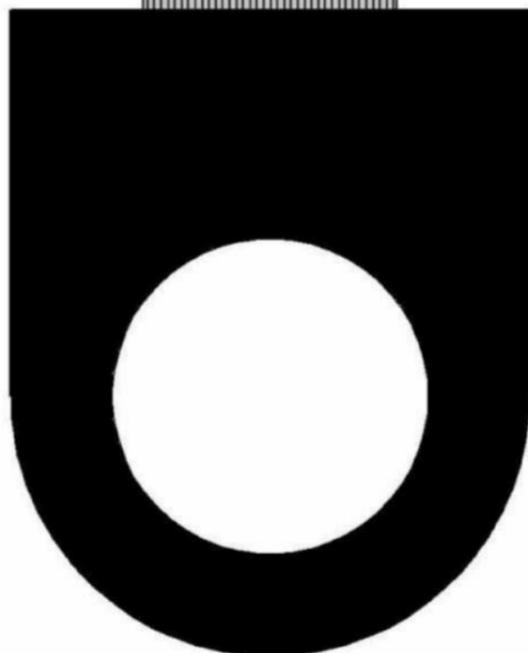

Basic Input Circuit

Measured Resistances were used to select series resistor values.

UNO Input voltage must be more than 3V when the wash programme LED is off (LDR in darkness) and less than 3V when the LED is on (illuminating the LDR).

Ribbon Cable

Complete sensor fixed to washing machine

| Pin | Wash Programme  | On (kΩ) | Off (kΩ) | Series Resistor (kΩ) | Volts on | Volts off |
|-----|-----------------|---------|----------|----------------------|----------|-----------|
| 1   | COTTON          | 300     | 6000     | 470                  | 1.9      | 4.6       |
| 2   | ECO COTTON      | 42      | 500      | 100                  | 1.5      | 4.2       |
